2-1. The steel framework is used to support the reinforced stone concrete slab that is used for an office. The slab is 200 mm thick. Sketch the loading that acts along members BE and FED . Take $a = 2$ m, $b = 5$ m. *Hint:* See Tables 1.2 and 1.4.

SOLUTION

Beam BE . Since $\frac{b}{a} = \frac{5 \text{ m}}{2 \text{ m}} = 2.5$, the concrete slab will behave as a one-way slab.

Thus, the tributary area for this beam is rectangular, as shown in Fig. a , and the intensity of the uniform distributed load is

200 mm thick reinforced stone concrete slab:
 $(23.6 \text{ kN/m}^3)(0.2 \text{ m})(2 \text{ m}) = 9.44 \text{ kN/m}$

Live load for office: $(2.40 \text{ kN/m}^2)(2 \text{ m}) = 4.80 \text{ kN/m}$
 14.24 kN/m

Ans.

Due to symmetry the vertical reactions at B and E are

$$B_y = E_y = (14.24 \text{ kN/m})(5)/2 = 35.6 \text{ kN}$$

The loading diagram for beam BE is shown in Fig. b .

Beam FED . The only load this beam supports is the vertical reaction of beam BE at E , which is $E_y = 35.6 \text{ kN}$. The loading diagram for this beam is shown in Fig. c .

2-2. Solve Prob. 2-1 with $a = 3\text{ m}$, $b = 4\text{ m}$.

SOLUTION

Beam BE. Since $\frac{b}{a} = \frac{4}{3} < 2$, the concrete slab will behave as a two-way slab. Thus,

the tributary area for this beam is the hexagonal area shown in Fig. *a*, and the maximum intensity of the distributed load is

$$\begin{aligned} \text{200 mm thick reinforced stone concrete slab: } & (23.6 \text{ kN/m}^3)(0.2 \text{ m})(3 \text{ m}) \\ & = 14.16 \text{ kN/m} \end{aligned}$$

$$\begin{aligned} \text{Live load for office: } & [(2.40 \text{ kN/m}^2)(3 \text{ m})] \\ & = 7.20 \text{ kN/m} \\ & \quad 21.36 \text{ kN/m} \end{aligned}$$

Ans.

Due to symmetry, the vertical reactions at *B* and *E* are

$$\begin{aligned} B_y = E_y &= \frac{2 \left[\frac{1}{2} (21.36 \text{ kN/m})(1.5 \text{ m}) \right] + (21.36 \text{ kN/m})(1 \text{ m})}{2} \\ &= 26.70 \text{ kN} \end{aligned}$$

The loading diagram for beam *BE* is shown in Fig. *b*.

Beam FED. The loadings that are supported by this beam are the vertical reaction of beam *BE* at *E* which is $E_y = 26.70 \text{ kN}$ and the triangular distributed load of which its tributary area is the triangular area shown in Fig. *a*. Its maximum intensity is

$$\begin{aligned} \text{200 mm thick reinforced stone concrete slab: } & (23.6 \text{ kN/m}^3)(0.2 \text{ m})(1.5 \text{ m}) \\ & = 7.08 \text{ kN/m} \end{aligned}$$

$$\begin{aligned} \text{Live load for office: } & (2.40 \text{ kN/m}^2)(1.5 \text{ m}) \\ & = 3.60 \text{ kN/m} \\ & \quad 10.68 \text{ kN/m} \end{aligned}$$

The loading diagram for beam *FED* is shown in Fig. *c*.

2-3. The floor system used in a school classroom consists of a 4-in. reinforced stone concrete slab. Sketch the loading that acts along the joist BF and side girder $ABCDE$. Set $a = 10$ ft, $b = 30$ ft. *Hint:* See Tables 1.2 and 1.4.

SOLUTION

Joist BF . Since $\frac{b}{a} = \frac{30 \text{ ft}}{10 \text{ ft}} = 3$, the concrete slab will behave as a one-way slab.

Thus, the tributary area for this joist is the rectangular area shown in Fig. a , and the intensity of the uniform distributed load is

$$\text{4-in.-thick reinforced stone concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (10 \text{ ft}) = 0.5 \text{ k/ft}$$

$$\begin{aligned} \text{Live load for classroom: } (0.04 \text{ k/ft}^2)(10 \text{ ft}) &= 0.4 \text{ k/ft} \\ &0.9 \text{ k/ft} \end{aligned}$$

Ans.

Due to symmetry, the vertical reactions at B and F are

$$B_y = F_y = (0.9 \text{ k/ft})(30 \text{ ft})/2 = 13.5 \text{ k}$$

Ans.

The loading diagram for joist BF is shown in Fig. b .

Girder $ABCDE$. The loads that act on this girder are the vertical reactions of the joists at B , C , and D , which are $B_y = C_y = D_y = 13.5 \text{ k}$. The loading diagram for this girder is shown in Fig. c .

(a)

(b)

(c)

*2-4. Solve Prob. 2-3 with $a = 10$ ft, $b = 15$ ft.

SOLUTION

Joist BF. Since $\frac{b}{a} = \frac{15 \text{ ft}}{10 \text{ ft}} = 1.5 < 2$, the concrete slab will behave as a two-way slab. Thus, the tributary area for the joist is the hexagonal area, as shown in Fig. a, and the maximum intensity of the distributed load is

$$\text{4-in.-thick reinforced stone concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (10 \text{ ft}) = 0.5 \text{ k/ft}$$

$$\begin{aligned} \text{Live load for classroom: } (0.04 \text{ k/ft}^2)(10 \text{ ft}) &= 0.4 \text{ k/ft} \\ &0.9 \text{ k/ft} \end{aligned}$$

Ans.

Due to symmetry, the vertical reactions at B and G are

$$B_y = F_y = \frac{2 \left[\frac{1}{2} (0.9 \text{ k/ft})(5 \text{ ft}) \right] + (0.9 \text{ k/ft})(5 \text{ ft})}{2} = 4.50 \text{ k} \quad \text{Ans.}$$

The loading diagram for beam BF is shown in Fig. b.

Girder ABCDE. The loadings that are supported by this girder are the vertical reactions of the joist at B, C and D, which are $B_y = C_y = D_y = 4.50$ k, and the triangular distributed load shown in Fig. a. Its maximum intensity is

4-in.-thick reinforced stone concrete slab:

$$(0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (5 \text{ ft}) = 0.25 \text{ k/ft}$$

$$\begin{aligned} \text{Live load for classroom: } (0.04 \text{ k/ft}^2)(5 \text{ ft}) &= 0.20 \text{ k/ft} \\ &0.45 \text{ k/ft} \end{aligned}$$

The loading diagram for the girder ABCDE is shown in Fig. c.

Ans.

2-5. Solve Prob. 2-3 with $a = 7.5$ ft, $b = 20$ ft.

SOLUTION

Beam BF. Since $\frac{b}{a} = \frac{20 \text{ ft}}{7.5 \text{ ft}} = 2.7 > 2$, the concrete slab will behave as a one-way slab. Thus, the tributary area for this beam is a rectangle, as shown in Fig. a, and the intensity of the distributed load is

$$\text{4-in.-thick reinforced stone concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (7.5 \text{ ft}) = 0.375 \text{ k/ft}$$

$$\begin{aligned} \text{Live load from classroom: } (0.04 \text{ k/ft}^2)(7.5 \text{ ft}) &= 0.300 \text{ k/ft} \\ &0.675 \text{ k/ft} \end{aligned}$$

Ans.

Due to symmetry, the vertical reactions at B and F are

$$B_y = F_y = \frac{(0.675 \text{ k/ft})(20 \text{ ft})}{2} = 6.75 \text{ k}$$

Ans.

The loading diagram for beam BF is shown in Fig. b.

Beam ABCD. The loading diagram for this beam is shown in Fig. c.

2-6. The frame is used to support a 2-in.-thick plywood floor of a residential dwelling. Sketch the loading that acts along members BG and $ABCD$. Set $a = 6$ ft, $b = 18$ ft. *Hint:* See Tables 1.2 and 1.4.

SOLUTION

Beam BG . Since $\frac{b}{a} = \frac{18 \text{ ft}}{6 \text{ ft}} = 3 > 2$, the plywood platform will behave as one-way slab. Thus, the tributary area for the beam is rectangular and shown shaded in Fig. a . The intensity of the uniform distributed load is

$$\text{2-in.-thick plywood platform: } \left(36 \frac{\text{lb}}{\text{ft}^2} \right) \left(\frac{2}{12} \text{ ft} \right) (6 \text{ ft}) = 36 \text{ lb/ft}$$

$$\text{Live load for residential dwelling: } \left(40 \frac{\text{lb}}{\text{ft}^2} \right) (6 \text{ ft}) = \frac{240 \text{ lb/ft}}{276 \text{ lb/ft}} \quad \text{Ans.}$$

Due to symmetry, the vertical reaction at B and G are

$$B_y = G_y = \frac{(276 \text{ lb/ft})(18 \text{ ft})}{2} = 2484 \text{ lb} \quad \text{Ans.}$$

The loading diagram for beam BG is shown in Fig. b .

Beam $ABCD$. The loads that act on this beam are the vertical reaction of beams BG and CF at B and C respectively, which are $C_y = B_y = 2484$ lb. The loading diagram of this beam is shown in Fig. c .

2-7. Solve Prob. 2-6, with $a = 10$ ft, $b = 10$ ft.

SOLUTION

Beam BG. Since $\frac{b}{a} = \frac{10 \text{ ft}}{10 \text{ ft}} = 1 < 2$, the plywood platform will behave as a two-way slab. Thus, the tributary area for this beam is the shaded square area shown in Fig. a, and the maximum intensity of the triangular distributed load is

$$\text{2-in.-thick plywood platform: } \left(36 \frac{\text{lb}}{\text{ft}^3} \right) \left(\frac{2}{12} \text{ ft} \right) (10 \text{ ft}) = 60 \text{ lb/ft}$$

$$\text{Live load for residential dwelling: } \left(40 \frac{\text{lb}}{\text{ft}^2} \right) (10 \text{ ft}) = \frac{400 \text{ lb/ft}}{460 \text{ lb/ft}}$$

Ans. $a = 10 \text{ ft}$

Due to symmetry, the vertical reaction at B and G are

$$B_y = G_y = \frac{\frac{1}{2} (460 \text{ lb/ft}) (10 \text{ ft})}{2} = 1150 \text{ lb}$$

Ans.

The loading diagram for beam BG is shown in Fig. b.

Beam ABCD. The loadings that are supported by this beam are the vertical reaction of beams BG and CF at B and C respectively, which are $B_y = C_y = 1150$ lb and the triangular distributed load contributed by the dotted triangular area shown in Fig. a. Its maximum intensity is

$$\text{2-in.-thick plywood platform: } \left(36 \frac{\text{lb}}{\text{ft}^3} \right) \left(\frac{2}{12} \text{ ft} \right) (5 \text{ ft}) = 30 \text{ lb/ft}$$

$$\text{Live load for residential dwelling: } \left(40 \frac{\text{lb}}{\text{ft}^2} \right) (5 \text{ ft}) = \frac{200 \text{ lb/ft}}{230 \text{ lb/ft}}$$

Ans.

The loading diagram for beam ABCD is shown in Fig. c.

Beam ABCD. 1150 lb at B and C, $w_{\max} = 230$ lb/ft

*2-8. Solve Prob. 2-6, with $a = 10$ ft, $b = 15$ ft.

SOLUTION

Beam BG. Since $\frac{b}{a} = \frac{15 \text{ ft}}{10 \text{ ft}} = 1.5 < 2$, the plywood platform will behave as a two-way slab. Thus, the tributary area for this beam is the shaded octagonal area shown in Fig. a, and the maximum intensity of the trapezoidal distributed load is

$$\text{2-in.-thick plywood platform: } \left(36 \frac{\text{lb}}{\text{ft}^3} \right) \left(\frac{2}{12} \text{ ft} \right) (10 \text{ ft}) = 60 \text{ lb/ft}$$

$$\text{Live load for residential dwelling: } \left(40 \frac{\text{lb}}{\text{ft}^2} \right) (10 \text{ ft}) = \frac{400 \text{ lb/ft}}{460 \text{ lb/ft}} \quad \text{Ans.}$$

Due to symmetry, the vertical reactions of B and G are

$$B_y = G_y = \frac{\frac{1}{2} (460 \text{ lb/ft}) (15 \text{ ft} + 5 \text{ ft})}{2} = 2300 \text{ lb} \quad \text{Ans.}$$

The loading diagram for beam BG is shown in Fig. b.

Beam ABCD. The loadings that are supported by this beam are the vertical reactions of beam BG and CF at B and C respectively which are $B_y = C_y = 2300$ lb, and the triangular distributed load contributed by the dotted triangular area shown in Fig. a. Its maximum intensity is

$$\text{2-in.-thick plywood platform: } \left(36 \frac{\text{lb}}{\text{ft}^3} \right) \left(\frac{2}{12} \text{ ft} \right) (5 \text{ ft}) = 30 \text{ lb/ft}$$

$$\text{Live load for residential dwelling: } (40 \text{ lb/ft}^2) (5 \text{ ft}) = \frac{200 \text{ lb/ft}}{230 \text{ lb/ft}} \quad \text{Ans.}$$

The loading diagram for beam ABCD is shown in Fig. c.

2-9. The steel framework is used to support the 4-in. reinforced stone concrete slab that carries a uniform live loading of 400 lb/ft^2 . Sketch the loading that acts along members BE and FED . Set $a = 9 \text{ ft}$, $b = 12 \text{ ft}$. *Hint:* See Table 1.2.

SOLUTION

Beam BE . Since $\frac{b}{a} = \frac{12 \text{ ft}}{9 \text{ ft}} = \frac{4}{3} < 2$, the concrete slab will behave as a two-way slab. Thus, the tributary area for this beam is the shaded octagonal area shown in Fig. a , and the maximum intensity of the trapezoidal distributed load is

$$\text{4-in.-thick reinforced stone concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (9 \text{ ft}) = 0.45 \text{ k/ft}$$

$$\text{Floor live load: } (0.4 \text{ k/ft}^2) (9 \text{ ft}) = \frac{3.60 \text{ k/ft}}{4.05 \text{ k/ft}}$$

Ans.

Due to symmetry, the vertical reactions at B and E are

$$B_y = E_y = \frac{\frac{1}{2} (4.05 \text{ k/ft}) (3 \text{ ft} + 12 \text{ ft})}{2} = 15.19 \text{ k}$$

Ans.

The loading diagram of beam BE is shown in Fig. a .

Beam FED . The loadings that are supported by this beam are the vertical reactions of beam BE at E , which is $E_y = 15.19 \text{ k}$ and the triangular distributed load contributed by dotted triangular tributary area shown in Fig. a . Its maximum intensity is

$$\text{4-in.-thick concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (4.5 \text{ ft}) = 0.225 \text{ k/ft}$$

$$\text{Floor live load: } (0.4 \text{ k/ft}^2) (4.5 \text{ ft}) = \frac{1.800 \text{ k/ft}}{2.025 \text{ k/ft}}$$

The loading diagram of beam FED is shown in Fig. c .

Beam BE . $w_{\max} = 4.05 \text{ k/ft}$

Beam FED . $15.2 \text{ k at } E$, $w_{\max} = 2.025 \text{ k/ft}$

2-10. Solve Prob. 2-9, with $a = 6$ ft, $b = 18$ ft.

SOLUTION

Beam BE. Since $\frac{b}{a} = \frac{18 \text{ ft}}{6 \text{ ft}} = 3 > 2$, the concrete slab will behave as a one-way slab. Thus, the tributary area for this beam is the shaded rectangular area shown in Fig. a, and the intensity of the uniform distributed load is

$$\text{4-in.-thick reinforced stone concrete slab: } (0.15 \text{ k/ft}^3) \left(\frac{4}{12} \text{ ft} \right) (6 \text{ ft}) = 0.30 \text{ k/ft}$$

$$\text{Floor live load: } (0.4 \text{ k/ft}^2)(6 \text{ ft}) = \frac{2.40 \text{ k/ft}}{2.70 \text{ k/ft}}$$

Ans.

Due to symmetry, the vertical reactions at B and E are

$$B_y = E_y = \frac{(2.70 \text{ k/ft})(18 \text{ ft})}{2} = 24.3 \text{ k}$$

The loading diagram of beam BE is shown in Fig. b.

Beam FED. The only load this beam supports is the vertical reaction of beam BE at E, which is $E_y = 24.3 \text{ k}$.

The loading diagram of beam FED is shown in Fig. c.

2-42. Determine the horizontal and vertical components of reaction at A , C , and D . Assume the frame is pin connected at A , C , and D , and there is a fixed-connected joint at B .

SOLUTION

Member CD :

$$\zeta + \Sigma M_D = 0; \quad -C_x(6) + 90(3) = 0$$

$$C_x = 45.0 \text{ kN}$$

$$\rightarrow \Sigma F_x = 0; \quad D_x + 45 - 90 = 0$$

$$D_x = 45.0 \text{ kN}$$

$$+\uparrow \Sigma F_y = 0; \quad D_y - C_y = 0$$

Member ABC :

$$\zeta + \Sigma M_A = 0; \quad C_y(5) + 45.0(4) - 50(1.5) - 40(3.5) = 0$$

$$C_y = 7.00 \text{ kN}$$

$$+\uparrow \Sigma F_y = 0; \quad A_y + 7.00 - 50 - 40 = 0$$

$$A_y = 83.0 \text{ kN}$$

$$\rightarrow \Sigma F_x = 0; \quad A_x - 45.0 = 0$$

$$A_x = 45.0 \text{ kN}$$

From Eq. (1).

$$D_y = 7.00 \text{ kN}$$

2-43. The bridge frame consists of three segments which can be considered pinned at A , D , and E , rocker supported at C and F , and roller supported at B . Determine the horizontal and vertical components of reaction at all these supports due to the loading shown.

SOLUTION

For segment BD :

$$\zeta + \sum M_D = 0; \quad 2(30)(15) - B_y(30) = 0 \quad B_y = 30 \text{ kip}$$

$$\pm \sum F_x = 0; \quad D_x = 0$$

$$+\uparrow \sum F_y = 0; \quad D_y + 30 - 2(30) = 0 \quad D_y = 30 \text{ kip}$$

For segment ABC :

$$\zeta + \sum M_A = 0; \quad C_y(5) - 2(15)(7.5) - 30(15) = 0 \quad C_y = 135 \text{ kip}$$

$$\pm \sum F_x = 0; \quad A_x = 0$$

$$+\uparrow \sum F_y = 0; \quad -A_y + 135 - 2(15) - 30 = 0 \quad A_y = 75 \text{ kip}$$

For segment DEF :

$$\zeta + \sum M_g = 0; \quad -F_y(5) + 2(15)(7.5) + 30(15) = 0 \quad F_y = 135 \text{ kip}$$

$$\pm \sum F_x = 0; \quad E_x = 0$$

$$+\uparrow \sum F_y = 0; \quad -E_y + 135 - 2(15) - 30 = 0 \quad E_y = 75 \text{ kip}$$

***2-44.** Determine the horizontal and vertical reactions at the connections A and C of the gable frame. Assume that A , B , and C are pin connections. The purlin loads such as D and E are applied perpendicular to the center line of each girder.

SOLUTION

Member AB :

$$\zeta + \Sigma M_A = 0; \quad B_x(15) + B_y(12) - (1200)(5) - 600\left(\frac{12}{13}\right)(6) - 600\left(\frac{5}{13}\right)(12.5) = 0$$

$$-400\left(\frac{12}{13}\right)(12) - 400\left(\frac{5}{13}\right)(15) = 0$$

$$B_x(15) + B_y(12) = 18,946.154$$

Member BC :

$$\zeta + \Sigma M_C = 0; \quad -B_x(15) + B_y(12) + 600\left(\frac{12}{13}\right)(6) + 600\left(\frac{5}{13}\right)(12.5) = 0$$

$$400\left(\frac{12}{13}\right)(12) + 400\left(\frac{5}{13}\right)(15) = 0$$

$$B_x(15) - B_y(12) = 12,446.15$$

Solving Eqs. (1) and (2),

$$B_x = 1063.08 \text{ lb.}$$

$$B_y = 250.0 \text{ lb}$$

Member AB :

$$\rightarrow \Sigma F_x = 0; \quad -A_x + 1200 + 1000\left(\frac{5}{13}\right) - 1063.08 = 0$$

$$A_x = 522 \text{ lb}$$

Ans.

$$+\uparrow \Sigma F_y = 0; \quad A_y - 800 - 1000\left(\frac{12}{13}\right) + 250 = 0$$

$$A_y = 1473 \text{ lb}$$

Ans.

Member BC :

$$\rightarrow \Sigma F_x = 0; \quad -C_x - 1000\left(\frac{5}{13}\right) + 1063.08 = 0$$

$$C_x = 678 \text{ lb}$$

Ans.

$$+\uparrow \Sigma F_y = 0; \quad C_y - 800 - 1000\left(\frac{12}{13}\right) - 250.0 = 0$$

2-1P. The railroad trestle bridge shown in the photo is supported by reinforced concrete bents. Assume the two simply supported side girders, track bed, and two rails have a weight of 0.5 k/ft and the load imposed by a train is 7.2 k/ft. Each girder is 20 ft long. Apply the load over the entire bridge and determine the compressive force in the columns of each bent. For the analysis assume all joints are pin connected and neglect the weight of the bent. Are these realistic assumptions?

SOLUTION

Maximum reactions occur when the live load is over the entire span.

$$\text{Load} = 7.2 + 0.5 = 7.7 \text{ k/ft}$$

$$R = 7.7(10) = 77 \text{ k}$$

$$\text{Then } P = \frac{2(77)}{2} = 77 \text{ k}$$

All members are two-force members.

$$\zeta + \Sigma M_B = 0; \quad -77(8) + F \sin 75^\circ(8) = 0$$

$$F = 79.7 \text{ k}$$

It is not reasonable to assume the members are pin connected, since such a framework is unstable.
