Chapter 1

Whole Numbers

Exercise Set 1.1

- RC2.** In 615,702, the number 615 is in the thousands period.
- RC4.** The number 721 is written in standard notation.
- CC2.** A word name for 42,000,000 is forty-two million.
- CC4.** A word name for 18,000,000,000 is eighteen billion.
- CC6.** A word name for 40,000,000,000,000 is forty trillion.
- 2.** 5 ten thousands
- 4.** 5 hundred thousands
- 6.** 9
- 8.** 3
- 10.** 6 thousands + 6 hundreds + 8 tens + 8 ones
- 12.** 1 thousand + 7 hundreds + 8 tens + 6 ones
- 14.** 3 ten thousands + 8 thousands + 4 hundreds + 5 tens + 3 ones
- 16.** 1 hundred thousand + 3 ten thousands + 5 thousands + 0 hundreds + 8 tens + 0 ones, or 1 hundred thousand + 3 ten thousands + 5 thousands + 8 tens
- 18.** 1 billion + 2 hundred millions + 6 ten millions + 6 millions + 8 hundred thousands + 8 ten thousands + 3 thousands + 5 hundreds + 9 tens + 8 ones
- 20.** 3 hundred millions + 2 ten millions + 3 millions + 9 hundred thousands + 9 ten thousands + 5 thousands + 5 hundreds + 2 tens + 8 ones
- 22.** Forty-eight
- 24.** Forty-five thousand, nine hundred eighty-seven
- 26.** One hundred eleven thousand, thirteen
- 28.** Forty-three billion, five hundred fifty million, six hundred fifty-one thousand, eight hundred eight
- 30.** Ninety-nine thousand, eight hundred fifty-three
- 32.** Two hundred twenty-six million, one thousand, two hundred eighty-eight
- 34.** 354,702
- 36.** 17,112
- 38.** 19,610,439
- 40.** 700,000,000
- 42.** 26,000,000,000

44. 200,017

46. 2,793,000,000

- 48.** All digits are 9's. Answers may vary. For an 8-digit read-out, for example, it would be 99,999,999. This number has three periods.

Exercise Set 1.2

- RC2.** In the addition $5 + 2 = 7$, the number 7 is the sum.

- RC4.** The distance around an object is its perimeter.

CC2. 110

CC4. 1700

CC6. 10,000

28. Perimeter = 14 mi + 13 mi + 8 mi + 10 mi + 47 mi + 22 mi

We carry out the addition.

$$\begin{array}{r} 2 \\ 1 \ 4 \\ 1 \ 3 \\ 8 \\ 1 \ 0 \\ 4 \ 7 \\ + 2 \ 2 \\ \hline 1 \ 1 \ 4 \end{array}$$

The perimeter of the figure is 114 mi.

30. Perimeter = 62 yd + 39 yd + 54 yd + 46 yd + 28 yd

We carry out the addition.

$$\begin{array}{r} 2 \\ 6 \ 2 \\ 3 \ 9 \\ 5 \ 4 \\ 4 \ 6 \\ + 2 \ 8 \\ \hline 2 \ 2 \ 9 \end{array}$$

The perimeter of the figure is 229 yd.

32. 90 ft + 90 ft + 90 ft + 90 ft = Perimeter

We carry out the addition.

$$\begin{array}{r} 9 \ 0 \\ 9 \ 0 \\ 9 \ 0 \\ + 9 \ 0 \\ \hline 3 \ 6 \ 0 \end{array}$$

The batter travels 360 ft when a home run is hit.

34. Nine billion, three hundred forty-six million, three hundred ninety-nine thousand, four hundred sixty-eight

The answer is 48 R 1.

2. $54 \div 9 = 6$ because $54 = 9 \cdot 6$.

4. $\frac{37}{37} = 1$ Any nonzero number divided by itself is 1.

6. $\frac{56}{1} = 56$ Any number divided by 1 is that same number.

8. $\frac{0}{32} = 0$ Zero divided by any nonzero number is 0.

10. $74 \div 0$ is not defined, because division by 0 is not defined.

12. $\frac{20}{4} = 5$ because $20 = 4 \cdot 5$.

70. Pairs of factors whose product is 36 are:

- 1 and 36
- 2 and 18
- 3 and 12
- 4 and 9
- 6 and 6

- a) The pair above whose sum is 13 is 4 and 9.
- b) The pair above whose difference is 0 is 6 and 6.
- c) The pair above whose sum is 20 is 2 and 18.
- d) The pair above whose difference is 9 is 3 and 12.

72. $34,584,132 \div 76 \underline{\hspace{1cm}} = 4 \underline{\hspace{1cm}}, 386$

Consider the related multiplication sentence:

$$4 \underline{\hspace{1cm}}, 386 \cdot 76 \underline{\hspace{1cm}} = 34,584,132$$

Since the ones digit of the product is 2, the missing ones digit must be either 2 or 7 ($6 \cdot 2 = 12$ and $6 \cdot 7 = 42$).

We try 2:

$$34,584,132 \div 762 = 45,386$$

We see that the missing ones digit is 2 and the missing thousands digit is 5.

3. The statement is true. See page 19 in the text.

4. The statement is false. For example, $3 \cdot 0 = 0$ and 0 is not greater than 3. Also, $1 \cdot 1 = 1$ and 1 is not greater than 1.

5. It is true that zero divided by any nonzero number is 0.

6. The statement is false. Any number divided by 1 is the number itself. For example, $\frac{27}{1} = 27$.

41. When numbers are being added, it does not matter how they are grouped.

42. Subtraction is not commutative. For example, $5 - 2 = 3$, but $2 - 5 \neq 3$.

43. Answers will vary. Suppose one coat costs \$150. Then the multiplication $4 \cdot \$150$ gives the cost of four coats.

Suppose one ream of copy paper costs \$4. Then the multiplication $\$4 \cdot 150$ gives the cost of 150 reams.

44. Using the definition of division, $0 \div 0 = a$ such that $a \cdot 0 = 0$. We see that a could be *any* number since $a \cdot 0 = 0$ for any number a . Thus, we cannot say that $0 \div 0 = 0$. This is why we agree not to allow division by 0.

- 56.** Let l = the total length of the bookshelves, in feet.

$$\text{Solve: } 6 \cdot 3 = l$$

$$l = 18 \text{ ft}$$

Since the total length of the bookshelves is greater than 16 ft, the shelves cannot be put side by side on the 16-ft wall.

$$\begin{array}{r} 15 \\ 8 \overline{) 960} \\ \underline{80} \\ 160 \\ \underline{160} \\ 0 \end{array}$$

$$\begin{array}{r} 147 \\ 32 \overline{) 4708} \\ \underline{96} \\ 150 \\ \underline{128} \\ 228 \\ \underline{224} \\ 4 \end{array}$$

The answer is 147 R 4.

- 62.** $A = l \times w = 211 \text{ ft} \times 46 \text{ ft} = 9706 \text{ sq ft}$

64. $x = 81 - 15 = 66$

66. Consider one student taking one class a “student-class unit.” Then let s = the total number of student-class units and p = the number of students taught by each instructor.

Solve: $1200 \cdot 5 = s$, $4 \cdot 30 = p$

$s = 6000$, $p = 120$

Now let n = the number of instructors.

Solve: $6000 \div 120 = n$

$n = 50$ instructors

 $9 \cdot 8 + 7 \cdot 6 - 5 \cdot 4 + 3 \cdot 2 \cdot 1 = 100.$

Chapter 1 Vocabulary Reinforcement

- The distance around an object is its perimeter.
- The minuend is the number from which another number is being subtracted.
- For large numbers, digits are separated by commas into groups of three, called periods.
- In the sentence $28 \div 7 = 4$, the dividend is 28.
- In the sentence $10 \times 1000 = 10,000$, 10 and 1000 are called factors and 10,000 is called the product.
- The number 0 is called the additive identity.
- The sentence $3 \times (6 \times 2) = (3 \times 6) \times 2$ illustrates the associative law of multiplication.
- We can use the following rule to check division:
 quotient $\cdot$ divisor + remainder = dividend.

Chapter 1 Concept Reinforcement

- The statement is true. See page 42 in the text.
- $a \div a = \frac{a}{a} = 1$, $a \neq 0$; the statement is true.
- $a \div 0$ is not defined, so the statement is false.
- The statement is false. For example, $1 + 2 = 5$ is not a true equation.
- The statement is true. See page 71 in the text.
- The statement is false. See page 73 in the text.

The answer is 315 R 14.

6. Round 36,468 to the nearest thousand.

3 6, 4 6 8
 $\uparrow$

The digit 6 is in the thousands place. Consider the next digit to the right. Since the digit, 4, is 4 or lower, round down, meaning that 6 thousands stays as 6 thousands. Then change the digits to the right of the thousands digit to zeros.

The answer is 36,000.

7. Since 78 is to the left of 81 on the number line, $78 < 81$.

$$\begin{array}{rcl} 8. & 24 \cdot x = 864 & \\ & \frac{24 \cdot x}{24} = \frac{864}{24} & \text{Dividing by 24} \\ & x = 36 & \end{array}$$

Check: $\frac{24 \cdot x = 864}{24 \cdot 36 \quad ? \quad 864}$
 $\frac{864}{864} \quad \text{TRUE}$

The solution is 36.

9. $6^3 = 6 \cdot 6 \cdot 6 = 216$

$$= 5 \times [13 + 39]$$

$$= 5 \times 52$$

$$= 260$$

51. We add the numbers and divide by the number of addends.

$$\frac{157 + 170 + 168}{3} = \frac{495}{3} = 165$$

52. **Familiarize.** Let x = the additional amount of money, in dollars, Natasha needs to buy the desk.

Translate.

$$\begin{array}{ccccccc} \text{Money} & & \text{plus} & & \text{Additional} & & \text{is} & & \text{Price} \\ \text{available} & & & & \text{amount} & & & & \text{of desk} \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ 196 & & + & & x & & = & & 698 \end{array}$$

Solve. We subtract 196 on both sides of the equation.

$$196 + x = 698$$

$$196 + x - 196 = 698 - 196$$

$$x = 502$$

Check. We can estimate.

$$196 + 502 \approx 200 + 500 \approx 700 \approx 698$$

The answer checks.

State. Natasha needs \$502 dollars.

53. **Familiarize.** Let b = the balance in Toni's account after the deposit.

Translate.

$$\begin{array}{ccccccc} \text{Original balance} & & \text{plus} & & \text{Deposit} & & \text{is} & & \text{New balance} \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ 406 & & + & & 78 & & = & & b \end{array}$$

Solve. We add on the left side.

$$406 + 78 = b$$

$$484 = b$$

Check. We can repeat the calculation. The answer checks.

State. The new balance is \$484.

54. **Familiarize.** Let y = the year in which the copper content of pennies was reduced.

$$\begin{array}{ccccccc} \text{Original} & & \text{plus} & & 73 \text{ yr} & & \text{is} & & \text{Year of} \\ \text{year} & & & & & & & & \text{copper reduction} \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ 1909 & & + & & 73 & & = & & y \end{array}$$

Solve. We add on the left side.

$$1909 + 73 = y$$

$$1982 = y$$

Check. We can estimate.

$$1909 + 73 \approx 1910 + 70 \approx 1980 \approx 1982$$

The answer checks.

State. The copper content of pennies was reduced in 1982.

- 55. Familiarize.** We first make a drawing. Let c = the number of cartons filled.

Translate.

Solve. We carry out the division.

$$\begin{array}{r} 19 \\ 12 \overline{)228} \\ \underline{12} \\ 108 \\ \underline{108} \\ 0 \end{array}$$

Thus, $19 = c$, or $c = 19$.

Check. We can check by multiplying: $12 \cdot 19 = 228$. Our answer checks.

State. 19 cartons were filled.

- 56. Familiarize.** This is a multistep problem. Let s = the cost of 13 stoves, r = the cost of 13 refrigerators, and t = the total cost of the stoves and refrigerators.

Translate.

Solve. We first carry out the multiplications in the first two equations.

$$\begin{array}{ll} 13 \cdot 425 = s & 13 \cdot 620 = r \\ 5525 = s & 8060 = r \end{array}$$

Now we substitute 5525 for s and 8060 for r in the third equation and then add on the left side.

$$s + r = t$$

$$5525 + 8060 = t$$

$$13,585 = t$$

Check. We repeat the calculations. The answer checks.

State. The total cost was \$13,585.

- 57. Familiarize.** Let b = the number of beehives the farmer needs.

Translate.

Solve. We carry out the division.

$$\begin{array}{r} 14 \\ 30 \overline{)420} \\ \underline{30} \\ 120 \\ \underline{120} \\ 0 \end{array}$$

Thus, $14 = b$, or $b = 14$.

Check. We can check by multiplying: $30 \cdot 14 = 420$. The answer checks.

State. The farmer needs 14 beehives.

- 58.** $A = l \cdot w = 14 \text{ ft} \cdot 7 \text{ ft} = 98 \text{ square ft}$

- 59. Familiarize.** We make a drawing. Let b = the number of beakers that will be filled.

Translate.

Solve. We carry out the division.

$$\begin{array}{r} 137 \\ 20 \overline{) 2753} \\ \underline{20} \\ 75 \\ \underline{60} \\ 153 \\ \underline{140} \\ 13 \end{array}$$

Thus, $137 \text{ R } 13 = b$.

Check. We can check by multiplying the number of beakers by 137 and then adding the remainder, 13.

$$137 \cdot 20 = 2740 \text{ and } 2740 + 13 = 2753$$

The answer checks.

State. 137 beakers can be filled; 13 mL will be left over.

- 60. Familiarize.** This is a multistep problem. Let b = the total amount budgeted for food, clothing, and entertainment and let r = the income remaining after these allotments.

Translate.

$$\begin{array}{ccccccc} \text{Food and} & & \text{Entertainment} & & & & \text{Total of} \\ \text{clothing} & \text{plus} & \text{budget} & \text{is} & & & \text{these allotments} \\ \text{budget} & & & & & & \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & & \\ 7825 & + & 2860 & = & b & & \\ \\ \text{Food, clothing,} & & \text{Remaining} & & \text{Total} \\ \text{and entertainment} & \text{plus} & \text{income} & \text{is} & \text{income} \\ \text{allotments} & & & & \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow \\ b & + & r & = & 38,283 \end{array}$$

Solve. We add on the left side to solve the first equation.

$$7825 + 2860 = b$$

$$10,685 = b$$

Now we substitute 10,685 for b in the second equation and solve for r .

$$b + r = 38,283$$

$$10,685 + r = 38,283$$

$$10,685 + r - 10,685 = 38,283 - 10,685$$

$$r = 27,598$$

Check. We repeat the calculations. The answer checks.

State. After the allotments for food, clothing, and entertainment, \$27,598 remains.

$$\begin{aligned} 61. \quad 7 + (4 + 3)^2 &= 7 + 7^2 \\ &= 7 + 49 \\ &= 56 \end{aligned}$$

Answer B is correct.

$$\begin{aligned} 62. \quad 7 + 4^2 + 3^2 &= 7 + 16 + 9 \\ &= 23 + 9 \\ &= 32 \end{aligned}$$

Answer A is correct.

$$\begin{aligned} 63. \quad & [46 - (4 - 2) \cdot 5] \div 2 + 4 \\ &= [46 - 2 \cdot 5] \div 2 + 4 \\ &= [46 - 10] \div 2 + 4 \\ &= 36 \div 2 + 4 \\ &= 18 + 4 \\ &= 22 \end{aligned}$$

Answer D is correct.

$$\begin{array}{r} 9d \\ \times d2 \\ \hline 8036 \end{array}$$

By using rough estimates, we see that the factor $d2 \approx 8100 \div 90 = 90$ or $d2 \approx 8000 \div 100 = 80$. Since $99 \times 92 = 9108$ and $98 \times 82 = 8036$, we have $d = 8$.

$$\begin{array}{r} 9a1 \\ 2b1 \overline{) 236421} \end{array}$$

Since $250 \times 1000 = 250,000 \approx 236,421$ we deduce that $2b1 \approx 250$ and $9a1 \approx 1000$. By trial we find that $a = 8$ and $b = 4$.

- 66.** At the beginning of each day the tunnel reaches 500 ft – 200 ft, or 300 ft, farther into the mountain than it did the day before. We calculate how far the tunnel reaches into the mountain at the beginning of each day, starting with Day 2.

Day 2: 300 ft

Day 3: $300 \text{ ft} + 300 \text{ ft} = 600 \text{ ft}$

Day 4: $600 \text{ ft} + 300 \text{ ft} = 900 \text{ ft}$

Day 5: $900 \text{ ft} + 300 \text{ ft} = 1200 \text{ ft}$

Day 6: $1200 \text{ ft} + 300 \text{ ft} = 1500 \text{ ft}$

We see that the tunnel reaches 1500 ft into the mountain at the beginning of Day 6. On Day 6 the crew tunnels an additional 500 ft, so the tunnel reaches $1500 \text{ ft} + 500 \text{ ft}$, or 2000 ft, into the mountain. Thus, it takes 6 days to reach the copper deposit.

Chapter 1 Discussion and Writing Exercises

1. No; if subtraction were associative, then $a - (b - c) = (a - b) - c$ for any a , b , and c . But, for example,

$$12 - (8 - 4) = 12 - 4 = 8,$$

whereas

$$(12 - 8) - 4 = 4 - 4 = 0.$$

Since $8 \neq 0$, this example shows that subtraction is not associative.

2. By rounding prices and estimating their sum a shopper can estimate the total grocery bill while shopping. This is particularly useful if the shopper wants to spend no more than a certain amount.

3. Answers will vary. Anthony is driving from Kansas City to Minneapolis, a distance of 512 miles. He stops for gas after driving 183 miles. How much farther must he drive?

4. The parentheses are not necessary in the expression $9 - (4 \cdot 2)$. Using the rules for order of operations, the multiplication would be performed before the subtraction even if the parentheses were not present.

The parentheses are necessary in the expression $(3 \cdot 4)^2$; $(3 \cdot 4)^2 = 12^2 = 144$, but $3 \cdot 4^2 = 3 \cdot 16 = 48$.

The answer is 805 R 8.

20. Round 34,528 to the nearest thousand.

3 4, $\boxed{5}$ 2 8
 $\uparrow$

The digit 4 is in the thousands place. Consider the next digit to the right, 5. Since 5 is 5 or higher, round 4 thousands up to 5 thousands. Then change all digits to the right of thousands to zeros.

The answer is 35,000.

21. Round 34,528 to the nearest ten.

$$\begin{array}{r} 34,52\boxed{8} \\ \uparrow \end{array}$$

The digit 2 is in the tens place. Consider the next digit to the right, 8. Since 8 is 5 or higher, round 2 tens up to 3 tens. Then change the digit to the right of tens to zero.

The answer is 34,530.

22. Round 34,528 to the nearest hundred.

$$\begin{array}{r} 34,5\boxed{2}8 \\ \uparrow \end{array}$$

The digit 5 is in the hundreds place. Consider the next digit to the right, 2. Since 2 is 4 or lower, round down, meaning that 5 hundreds stays as 5 hundreds. Then change all digits to the right of hundreds to zero.

The answer is 34,500.

23. Rounded to

47. **Familiarize.** We make a drawing.

Observe that the dimensions of two sides of the container are 8 in. by 6 in. The area of each is $8 \text{ in.} \cdot 6 \text{ in.}$ and their total area is $2 \cdot 8 \text{ in.} \cdot 6 \text{ in.}$ The dimensions of the other two sides are 12 in. by 6 in. The area of each is $12 \text{ in.} \cdot 6 \text{ in.}$ and their total area is $2 \cdot 12 \text{ in.} \cdot 6 \text{ in.}$ The dimensions of the bottom of the box are 12 in. by 8 in. and its area is $12 \text{ in.} \cdot 8 \text{ in.}$ Let c = the number of square inches of cardboard that are used for the container.

Translate. We add the areas of the sides and the bottom of the container.

$$2 \cdot 8 \text{ in.} \cdot 6 \text{ in.} + 2 \cdot 12 \text{ in.} \cdot 6 \text{ in.} + 12 \text{ in.} \cdot 8 \text{ in.} = c$$

Solve. We carry out the calculation.

$$\begin{aligned} 2 \cdot 8 \text{ in.} \cdot 6 \text{ in.} + 2 \cdot 12 \text{ in.} \cdot 6 \text{ in.} + 12 \text{ in.} \cdot 8 \text{ in.} &= c \\ 96 \text{ sq in.} + 144 \text{ sq in.} + 96 \text{ sq in.} &= c \\ 336 \text{ sq in.} &= c \end{aligned}$$

Check. We can repeat the calculations. The answer checks.

State. 336 sq in. of cardboard are used for the container.

48. We can reduce the number of trials required by simplifying the expression on the left side of the equation and then using the addition principle.

$$\begin{aligned} 359 - 46 + a \div 3 \times 25 - 7^2 &= 339 \\ 359 - 46 + a \div 3 \times 25 - 49 &= 339 \\ 359 - 46 + \frac{a}{3} \times 25 - 49 &= 339 \\ 359 - 46 + \frac{25 \cdot a}{3} - 49 &= 339 \\ 313 + \frac{25 \cdot a}{3} - 49 &= 339 \\ 264 + \frac{25 \cdot a}{3} &= 339 \\ 264 + \frac{25 \cdot a}{3} - 264 &= 339 - 264 \\ \frac{25 \cdot a}{3} &= 75 \end{aligned}$$

We see that when we multiply a by 25 and divide by 3, the result is 75. By trial, we find that $\frac{25 \cdot 9}{3} = \frac{225}{3} = 75$, so $a = 9$. We could also reason that since $75 = 25 \cdot 3$ and $9/3 = 3$, we have $a = 9$.

49. **Familiarize.** First observe that a 10-yr loan with monthly payments has a total of $10 \cdot 12$, or 120, payments. Let m = the number of monthly payments represented by \$9160 and let p = the number of payments remaining after \$9160 has been repaid.

Translate. First we will translate to an equation that can be used to find m . Then we will write an equation that can be used to find p .

Payments to date	divided by	Amount of each payment	is	Number of payments made
↓	↓	↓	↓	↓
9160	$\div$	229	$=$	m

$$\begin{array}{ccccccc}
 \text{Payments} & & \text{plus} & & \text{Remaining} & & \text{Total number} \\
 \text{already made} & & & & \text{payments} & & \text{of payments} \\
 \hline
 \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 m & & + & & p & & = 120
 \end{array}$$

Solve. To solve the first equation we carry out the division.

$$\begin{array}{r}
 40 \\
 229 \overline{) 9160} \\
 \underline{916} \\
 0 \\
 0 \\
 \underline{0}
 \end{array}$$

Thus, $m = 40$.

Now we solve the second equation.

$$\begin{aligned}
 m + p &= 120 \\
 40 + p &= 120 && \text{Substituting 40 for } m \\
 40 + p - 40 &= 120 - 40 \\
 p &= 80
 \end{aligned}$$

Check. We can approach the problem in a different way to check the answer. In 10 years, Cara's loan payments will total $120 \cdot \$229$, or \$27,480. If \$9160 has already been paid, then $\$27,480 - \$9160$, or \$18,320, remains to be paid. Since $80 \cdot \$229 = \$18,320$, the answer checks.

State. 80 payments remain on the loan.
