CHAPTER 2 MATERIALS

SOLUTION (2.1)

$$A_0 = \frac{\pi}{4} (12.5)^2 = 122.7 \text{ mm}^2, \quad A_f = \frac{\pi}{4} (12.5 - 0.006)^2 = 122.6 \text{ mm}^2$$

$$\text{We have } \varepsilon_a = \frac{0.3}{200} = 1500 \mu, \quad \varepsilon_t = \frac{0.006}{12.5} = 480 \mu$$

Thus

$$S_p = \frac{P}{A_0} = \frac{18(10^3)}{122.7} = 146.8 \text{ MPa}$$

$$E = \frac{S_p}{\varepsilon_a} = \frac{146.7(10^6)}{1500(10^{-6})} = 97.8 \text{ GPa}, \quad \nu = \frac{\varepsilon_t}{\varepsilon_a} = 0.32 \quad \blacktriangleleft$$

Also

$$\% \text{ elongation} = \frac{0.3}{200}(100) = 0.15$$

$$\% \text{ reduction in area} = \frac{122.7 - 122.6}{122.7}(100) = 0.082 \quad \blacktriangleleft$$

SOLUTION (2.2)

Normal stress is

$$\sigma = \frac{P}{A} = \frac{2200}{\frac{\pi}{4}(3.125)^2} = 286.8 \text{ MPa}$$

This is below the yield strength of 350 MPa (Table B.1).

We have

$$\varepsilon = \frac{\delta}{L} = \frac{7.5}{5600} = 0.001339 = 1339 \mu$$

Hence

$$E = \frac{\sigma}{\varepsilon} = \frac{286.8(10^6)}{1339(10^{-6})} = 214.2 \text{ GPa} \quad \blacktriangleleft$$

SOLUTION (2.3)

$$\text{The cross-sectional area: } A = w_o t_o = 12.7(6.1) = 77.47 \text{ mm}^2$$

(a) Axial strain and axial stress are

$$\varepsilon_a = \frac{0.0841}{63.5} = 0.001324 = 1324 \mu$$

$$\sigma_a = \frac{P}{A} = \frac{21,500}{77.47(10^{-6})} = 277.5 \text{ MPa}$$

Because $\sigma_a < S_y$ (See Table B.1), Hooke's Law is valid.

(b) Modulus of elasticity,

$$E = \frac{\sigma_a}{\varepsilon_a} = \frac{277.5(10^6)}{1324(10^{-6})} = 209.6 \text{ GPa}$$

(c) Decrease in the width and thickness

$$\Delta w = \nu w_o = 0.3(12.7) = 3.81 \text{ mm} \quad \blacktriangleleft$$

$$\Delta t = \nu t_o = 0.3(6.1) = 1.83 \text{ mm}$$

SOLUTION (2.4)

Assume Hooke's Law applies. We have

$$\varepsilon_t = -\frac{1.5}{5} = -300 \mu$$

$$\varepsilon_a = -\frac{\varepsilon_t}{\nu} = -\frac{-300}{0.34} = 822 \mu$$

Thus,

$$\sigma = E \varepsilon_a = (105 \times 10^9)(822 \times 10^{-9}) = 92.61 \text{ MPa}$$

Since $\sigma < S_y$, our assumption is valid.

So

$$P = \sigma A = (92.61)(\pi/4)(5)^2 = 1.818 \text{ kN}$$

SOLUTION (2.5)

We obtain

$$L_{AC} = L_{BD} = \sqrt{15^2 + 15^2} = 21.21 \text{ mm}$$

$$\varepsilon_x = \frac{\Delta L_{AC}}{L_{AC}} = \frac{21.17 - 21.21}{21.21} = -1886 \mu$$

$$\varepsilon_y = \frac{\Delta L_{BD}}{L_{BD}} = \frac{21.22 - 21.21}{21.21} = 471 \mu$$

$$(a) \quad E = \frac{\sigma_x}{\varepsilon_x} = \frac{100(10^6)}{-1886(10^{-6})} = 53 \text{ GPa}$$

$$(b) \quad \nu = \frac{\varepsilon_y}{\varepsilon_x} = \left| \frac{471}{1886} \right| = 0.25$$

$$(c) \quad G = \frac{53}{2(1+0.25)} = 21.2 \text{ GPa}$$

SOLUTION (2.6)

Use generalized Hooke's law:

$$\varepsilon_x + \varepsilon_y + \varepsilon_z = \frac{1-2\nu}{E}(\sigma_x + \sigma_y + \sigma_z) \quad (1)$$

For a constant triaxial state of stress:

$$\varepsilon_x = \varepsilon_y = \varepsilon_z = \varepsilon, \quad \sigma_x = \sigma_y = \sigma_z = \sigma$$

Then, Eq. (1) becomes $\varepsilon = \frac{1-2\nu}{E}\sigma$. Since σ and ε must have identical signs:

$$1 - 2\nu \geq 0 \quad \text{or} \quad \nu = \frac{1}{2}$$

SOLUTION (2.7)

$$\text{We have } \sigma_x = \frac{450(10^3)}{50(75)} = 120 \text{ MPa}$$

(CONT.)

2.7 (CONT.)

$$(a) \quad \varepsilon_x = \frac{0.5}{250} = 2000 \mu, \quad \varepsilon_y = -\frac{0.025}{50} = -500 \mu$$

$$\nu = \left| \frac{500}{2000} \right| = 0.25$$

$$(b) \quad E = \frac{\sigma_x}{\varepsilon_x} = \frac{120(10^6)}{2000(10^{-6})} = 60 \text{ GPa}$$

$$(c) \quad \varepsilon_z = -\frac{\nu \sigma_x}{E} = -0.25 \frac{120(10^6)}{60(10^9)} = -500 \mu$$

$$\Delta a = -500(10^{-6})75 = -37.5(10^{-3}) \text{ mm}; \quad a' = 75 - 0.0375 = 74.9625 \text{ mm}$$

$$(d) \quad G = \frac{60(10^9)}{2(1+0.25)} = 24 \text{ GPa}$$

SOLUTION (2.8)

We have

$$\varepsilon_y = \varepsilon_z = 0 \quad \sigma_x = \frac{25(10^3)}{20 \times 10(10^{-6})} = 125 \text{ MPa}$$

Thus

$$\varepsilon_y = 0 = \frac{1}{E} [\sigma_y - \nu(\sigma_x + \sigma_z)] \quad (1)$$

$$\varepsilon_z = 0 = \frac{1}{E} [\sigma_z - \nu(\sigma_x + \sigma_y)] \quad (2)$$

$$\varepsilon_x = \frac{1}{E} [\sigma_x - \nu(\sigma_y + \sigma_z)] \quad (3)$$

Equations (1) and (2) become

$$\sigma_y - \nu \sigma_z = \nu \sigma_x \quad (1')$$

$$\sigma_z - \nu \sigma_y = \nu \sigma_x \quad (2')$$

Adding: $\nu(\sigma_y + \sigma_z) = 2\nu^2 \sigma_x / (1 - \nu)$. Then, Eq. (3):

$$\varepsilon_x = \frac{1 - \nu - 2\nu^2}{1 - \nu} \frac{\sigma_x}{E}$$

Substituting the data:

$$\varepsilon_x = \frac{1 - 0.3 - 0.18}{0.7} \frac{125(10^6)}{70(10^9)} = 1327 \mu$$

SOLUTION (2.9)

Hooke's Law. We have $\sigma_y = 0$ and

$$\begin{aligned} \varepsilon_x &= \frac{\sigma_x}{E} - \frac{\nu \sigma_y}{E} - \frac{\nu \sigma_z}{E} \\ &= \frac{10^6}{72 \times 10^9} [(80) - 0 - 0.3(140)] = 0.000528 = 528 \mu \end{aligned}$$

$$\begin{aligned} \varepsilon_y &= -\frac{\nu \sigma_x}{E} + \frac{\sigma_y}{E} - \frac{\nu \sigma_z}{E} \\ &= \frac{10^6}{72 \times 10^9} [-0.3(80) + 0 - 0.3(140)] = -917 \mu \end{aligned}$$

$$\begin{aligned} \varepsilon_z &= -\frac{\nu \sigma_x}{E} - \frac{\nu \sigma_y}{E} + \frac{\sigma_z}{E} \\ &= \frac{10^6}{72 \times 10^9} [-0.3(80) - 0 + 140] = 1611 \mu \end{aligned}$$

(CONT.)

2.9 (CONT.)

(a) Change in length $\Delta L_{AB} = \varepsilon_x a$,

$$\Delta L_{AB} = (528 \times 10^{-6})(320) = 0.169 \text{ mm}$$

(b) Change in thickness

$$\Delta t = \varepsilon_y t = (-917 \times 10^{-6})(15) = -0.014 \text{ mm}$$

(c) Change in volume,

$$e = \varepsilon_x + \varepsilon_y + \varepsilon_z = 528 - 917 + 1611 = 1.222$$

$$\Delta V = e V_o = 1.222(320 \times 320 \times 15) = 1.877 \text{ m m}^3$$

SOLUTION (2.10)

By assumptions, rubber in triaxial stress:

$$\sigma_x = \sigma_z = -p, \quad \sigma_y = -\frac{F}{\pi d^2/4} = -\frac{4F}{\pi d^2}$$

Strains are $\varepsilon_x = \varepsilon_z = 0$. Hooke's law gives

$$\varepsilon_x = 0 = \frac{1}{E}[\sigma_x - \nu(\sigma_y + \sigma_z)]$$

or

$$0 = p - \nu \frac{4F}{\pi d^2(1-\nu)}$$

Solving,

$$p = \frac{4\nu F}{\pi d^2(1-\nu)}$$

Q.E.D.

Substitute the data:

$$p = \frac{4(0.5)(10 \times 10^3)}{\pi (62.5)^2 (1-0.5)} = 3.26 \text{ MPa (C)}$$

SOLUTION (2.11)

Hooke's law gives

$$\varepsilon_x = \frac{1}{E}(\sigma_x - \nu\sigma_y) = \frac{10^6}{100(10^9)}(150 - \frac{90}{3}) = 1800 \text{ } \mu$$

$$\varepsilon_y = \frac{1}{E}(\sigma_y - \nu\sigma_x) = \frac{10^6}{100(10^9)}(-90 - \frac{150}{3}) = -1400 \text{ } \mu$$

$$\varepsilon_z = -\frac{\nu}{E}(\sigma_x + \sigma_y) = -\frac{(1/3)10^6}{100(10^9)}(150 - 90) = -200 \text{ } \mu$$

Thus

$$\Delta L = 1800 \text{ } \mu(100) = 180 \text{ } \mu\text{m}$$

$$\Delta a = -1400 \text{ } \mu(50) = -70 \text{ } \mu\text{m}$$

$$\Delta b = -200 \text{ } \mu(10) = -2 \text{ } \mu\text{m}$$

and

$$L' = 100.018 \text{ mm}, \quad a' = 49.993 \text{ mm}, \quad b' = 9.9998 \text{ mm}$$

SOLUTION (2.12)

We have

$$\sigma_x = \sigma_y = \sigma_z = -p$$

Gen. Hooke's law:

$$\varepsilon_x = \varepsilon_y = \varepsilon_z = -\frac{p}{E}(1 - 2\nu) = -\frac{120(10^6)}{100(10^9)} \frac{1}{3} = -400 \mu$$

Thus

$$\Delta L = -400 \mu(100) = -40 \mu\text{m}$$

$$\Delta a = -400 \mu(50) = -20 \mu\text{m}$$

$$\Delta b = -400 \mu(10) = -4 \mu\text{m}$$

and

$$L' = 99.96 \text{ mm}, \quad a' = 49.98 \text{ mm}, \quad b' = 9.996 \text{ mm} \quad \blacktriangleleft$$

SOLUTION (2.13)

We have

$$\sigma_x = \sigma_y = \sigma_z = -p. \text{ The volume is}$$

$$V_o = \frac{4}{3}\pi r^3 = \frac{4\pi}{3}(125)^3 = 8.181(10^6) \text{ m m}^3$$

$$\begin{aligned} \text{(a)} \quad \varepsilon_x &= -\frac{1}{E}[\sigma - \nu(\sigma + \sigma)] = -\frac{\sigma}{E}(1 - 2\nu) \\ &= \frac{168(10^6)}{70(10^9)}(1 - 0.5) = -1200 \mu \end{aligned}$$

Change in diameter,

$$\Delta d = \varepsilon_x d = -1200(10^{-6})250 = -0.3 \text{ mm}$$

Decrease in circumference:

$$\pi(\Delta d) = -0.3\pi = -0.9425 \text{ mm} \quad \blacktriangleleft$$

$$\begin{aligned} \text{(b)} \quad \Delta V &= eV_o = (1 - 2\nu)\varepsilon_x V_o \\ &= (0.5)(-1200 \times 10^{-6})(8.181 \times 10^6) = -4909 \text{ m m}^3 \quad \blacktriangleleft \end{aligned}$$

SOLUTION (2.14)

From Fig.2.3b and Eq.2.20:

$$U_t = \frac{S_y + S_u}{2} \varepsilon_f \approx \frac{250 + 440}{2}(0.27) \approx 93 \text{ MPa} \quad \blacktriangleleft$$

$$\text{We have } L_f = 50 + 50(0.27) = 63.5 \text{ mm}$$

$$\text{Using Eq.(2.1): } \% \text{ elongation} = \frac{63.5 - 50}{50}(100) = 27 \% \quad \blacktriangleleft$$

SOLUTION (2.15)

Table B.1: $S_y = 260 \text{ MPa}$, $E = 70 \text{ GPa}$

We have

$$V = AL = \frac{\pi}{4} (0.005)^2 (3) = 58.9 \times 10^{-6} \text{ m}^3$$

$$U_r = \frac{S_y^2}{2E} = \frac{(260 \times 10^6)^2}{2(70 \times 10^9)} = 482.9 \text{ kJ/m}^3$$

$$U_{app} = U_r V = 482.9 \times 10^3 (58.9 \times 10^{-6}) = 28.44 \text{ J}$$

For $U_{app} = 9 \text{ J}$:

$$n = \frac{28.44}{9} = 3.16$$

◀

SOLUTION (2.16)

(a) ASTM-A242. $E = 200 \text{ GPa}$ and $\sigma_y = 345 \text{ MPa}$

$$U_o = \frac{S_y^2}{2E} = \frac{(345 \times 10^6)^2}{2(200 \times 10^9)} = 298 \frac{\text{kJ}}{\text{m}^3}$$

◀

(b) Stainless (302). $E = 190 \text{ GPa}$ and $S_y = 520 \text{ MPa}$

$$U_o = \frac{S_y^2}{2E} = \frac{(520 \times 10^6)^2}{2(200 \times 10^9)} = 712 \frac{\text{kJ}}{\text{m}^3}$$

◀

SOLUTION (2.17)

(a) Aluminum 2014-T6. $E = 72 \text{ GPa}$ and $\sigma_y = 410 \text{ MPa}$

$$\begin{aligned} U_o &= \frac{S_y^2}{2E} = \frac{(410 \times 10^6)^2}{2(72 \times 10^9)} \\ &= 1167 \frac{\text{kJ}}{\text{m}^3} \end{aligned}$$

◀

(b) Annealed yellow brass. $E = 105 \text{ GPa}$ and $S_y = 105 \text{ MPa}$

$$U_o = \frac{S_y^2}{2E} = \frac{(105 \times 10^6)^2}{2(105 \times 10^9)} = 52.5 \frac{\text{kJ}}{\text{m}^3}$$

◀

SOLUTION (2.18)

Referring to Fig. P2.18: $E = \frac{105(10^6)}{0.0025} = 42 \text{ GPa}$, $S_y = 192.5 \text{ MPa}$

$$(a) U_o = \frac{S_y^2}{2E} = \frac{(192.5 \times 10^6)^2}{2(42 \times 10^9)} = 441.5 \text{ kJ/m}^3$$

◀

(b) Total area under $\sigma - \epsilon$ diagram:

$$U_t \approx 262.5(10^6)(0.176) = 46.2 \text{ MJ/m}^3$$

◀

SOLUTION (2.19)

$$(a) \quad V = 50 \times 50 \times 1,500 = 3.75 (10^6) \text{ mm}^3$$

$$\text{Thus} \quad nU = \frac{S_y^2}{2E} V$$

$$\text{or} \quad S_y = \left[\frac{2EnU}{V} \right]^{\frac{1}{2}} \\ = \left[\frac{2 \times 200 \times 10^9 \times 1.5 \times 400}{3.75 (10^{-3})} \right]^{\frac{1}{2}} = 253 \text{ MPa} \quad \blacktriangleleft$$

$$(b) \quad U_r = \frac{S_y^2}{2E} = \frac{(253 \times 10^6)^2}{2(200 \times 10^9)} = 160 \text{ kPa} \quad \blacktriangleleft$$

SOLUTION (2.20)

$$\text{Table B.1:} \quad S_y = 250 \text{ MPa}, \quad E = 200 \text{ GPa}$$

We have

$$U = nU_{app} = 5(17) = 85 \text{ N} \cdot \text{m}$$

$$U_r = \frac{S_y^2}{2E} = \frac{(250 \times 10^6)^2}{2(200 \times 10^9)} = 156.25 \text{ kN} \cdot \text{m/m}^3$$

Therefore

$$V = \frac{U}{U_r} = \frac{85}{156.25(10^3)} = 0.544(10^{-3}) \text{ m}^3$$

$$\text{Also} \quad V = AL : \quad 0.544(10^{-3}) = \frac{\pi}{4} d^2 (2.4)$$

or

$$d = 0.017 \text{ m} = 17 \text{ mm} \quad \blacktriangleleft$$

SOLUTION (2.21)

Refer to Fig. P2.21. We have

$$E = \frac{190(10^6)}{0.001} = 190 \text{ GPa}, \quad S_y \approx 245 \text{ MPa}$$

$$(a) \quad U_o = \frac{S_y^2}{2E} = \frac{(245 \times 10^3)^2}{2(190 \times 10^9)} = 158 \frac{\text{kJ}}{\text{m}^3} \quad \blacktriangleleft$$

(b) Total area under $\sigma - \varepsilon$ diagram:

$$U_t \approx 350 \times 10^3 (0.28) = 98 \frac{\text{MJ}}{\text{m}^3} \quad \blacktriangleleft$$

SOLUTION (2.22)

$$V = (0.05)(0.05)(1.2) = 0.003 \text{ m}^3 \text{ and } S_y \approx S_p$$

$$(a) \quad n \cdot U = \frac{S_p^2}{2E} V, \quad S_p^2 = \frac{nU(2E)}{V}$$

Substituting the data given,

(CONT.)

2.22 (CONT.)

$$S_p^2 = \frac{1.8(150)(2 \times 210 \times 10^9)}{0.003} = 37.8 \times 10^{15}$$

or

$$S_p = 194.4 \text{ MPa}$$

$$(b) U_o = \frac{S_p^2}{2E} = \frac{37.8 \times 10^{15}}{2(210 \times 10^9)} = 90 \frac{\text{kJ}}{\text{m}^3}$$

SOLUTION (2.23)

Applying Eq. (2.22), we find

$$S_u = 3.45 H_B \text{ MPa} = 3.45(149) = 514 \text{ MPa}$$

Equation (2.24):

$$S_y = 3.62(149) - 207 = 332.4 \text{ MPa}$$

SOLUTION (2.24)

Using Eq. (2.22),

$$S_u = 3.45 H_B \text{ MPa} = 3.45(179) = 618 \text{ MPa}$$

Formula (2.24):

$$S_y = 3.62(179) - 207 = 441 \text{ MPa}$$

SOLUTION (2.25)

Formula (2.22),

$$S_u = 3.45 H_B \text{ MPa} = 3.45(156) = 538 \text{ MPa}$$

Equation (2.24):

$$S_y = 3.62(156) - 207 = 378 \text{ MPa}$$

SOLUTION (2.26)

Equation (2.22) gives

$$S_u = 3.45 H_B \text{ MPa} = 3.45(293) = 1010.9 \text{ MPa}$$

Formula (2.24):

$$S_y = 3.62(293) - 207 = 853.7 \text{ MPa}$$
